HYDROSTATIC TEST CABINS

Our company prepares hydrostatic test cabins tailored to customer requirements in the prefabricated containers provided by us or by the customer. Pressure rating of the instrumentation piping is either 6.000 psi (414 bar) or 10.000 psi (690 bar). Analog and/or digital pressure gauges, test gauge, pressure transmitter, temperature transmitter, mechanical or electronic temperature and/or pressure chart recorder, deadweight tester are among the instruments installed in the cabin.

Instrumentation piping are composed of 12mm or ½" tubing, compression fittings, manifold, ball, check and needle valves in stainless steel or carbon steel. The instruments are installed wall-mounted, cabinet-mounted and/or bench-top. Bench may have a cabinet underneath. We can install a section with bed, air condition and a generator depending on customer's request.

Following are sample photos of test cabins we already prepared:
